Owner: Dana Logan
Practitioner: Mark Weber

Patient: Mighty Mite
Species/Breed: Dog / Labradoodle
Age/Gender: 8 Month(s) / male
Submitted Date: 12/01/2020 10:41:49 AM
Completed Date: 12/01/2020 02:44:12 PM

Case Status/Priority: Completed / Regular

Case History:

hip only evaluation in OFA format

Case Report:

510959 KW/ml

Two digitalized radiographic images containing ventrodorsal projections of the pelvis were submitted for evaluation. The radiographs are dated 11/27/20.

Radiographic Findings:

Both femoral heads are well-seated in their respective acetabula with greater than 50% of the femoral heads are medial to the dorsal acetabular rims.

Both femoral heads are congruous with the acetabula.

There is slight smooth remodeling of the femoral necks.

No osteophyte formation is present on the femoral necks or acetabula.

Alignment of the patellae with the femurs is normal.

Muscle volume in both hind legs is within normal limits.

Diagnosis: Normal pelvis.

Comments: Radiographic changes to suggest hip dysplasia are not present. Based on the OFA scheme evaluating hips, the hips would be rated as excellent in conformation. Radiographs obtained at 2 years of age will need to be evaluated to completely exclude hip dysplasia and to establish a final rating on the coxofemoral joints.
