Report for case 518487

Client: Newberg Veterinary Hospital	Patient: Mighty Mite
Email: frontdesk@newbergvet.com	Species/Breed: Dog / Labradoodle
Phone/Fax: 5035388303 / 503-538-8305	Age/Gender: 11 Month(s) / male
Owner: Dana Logan	Submitted Date: 02/18/2021 02:48:44 PM
Practitioner: Mark Weber	Completed Date: 02/19/2021 10:40:50 AM

Case Status/Priority: Completed / Regular

Case History:

elbow evaluation of a style, radiographs were not taken at original visit for hips

Case Report:

518487 KW/bs

Two digitalized radiographic images containing lateral projections of the elbows were submitted for evaluation. The radiographs are dated 2/17/20.

Radiographic Findings:

The anconeal process of both ulnae and proximocranial aspect of both radii are smooth with no evidence of osteophyte formation.

No sclerosis is associated with the ulnar notches.

The medial coronoid processes are smooth in contour and a fragment associated with the medial coronoid processes is not identified.

Diagnosis: Normal elbows.

Comments: Radiographic changes to suggest elbow dysplasia are not present. Radiographs obtained at 2 years of age will need to be evaluated to completely exclude elbow dysplasia.
